## Earth's Seasons

### Earth's Seasons

Tilt of the Earth is  $23\frac{1}{2}$  degrees from the perpendicular. Earth revolves around sun. In Northern Hemisphere: summer—Earth tilts toward sun and receives strong, direct sun rays, high temperatures; winter—Earth tilts away from sun and receives weak, slanted sun rays, lower temperatures; spring and autumn—Earth tilts neither toward nor away from sun, moderate temperatures.

1. The Earth is closer to the sun by 4 million km during the season of winter.
2. The Earth's axis is tilted as the Earth revolves around the Sun.
3. Direct rays from the sun cause warmer/hotter temperatures than do slanted rays.
4. In the Southern Hemisphere, the seasons are opposite those in the Northern Hemisphere.
