

### Exponential Population Model

If a population  $P$  is changing at a constant percentage rate  $r$  each year, then

$$P(t) = P_0(1 + r)^t,$$

where  $P_0$  is the initial population,  $r$  is expressed as a decimal, and  $t$  is time in years.

If  $r > 0$ , then \_\_\_\_\_

If  $r < 0$ , then \_\_\_\_\_

Example 1) Tell whether the function is an exponential growth or exponential decay function, and find the constant percentage rate of growth or decay.

a)  $P(t) = 78,963 \cdot 0.968^t$

b)  $f(x) = 247 \cdot 2^x$

Example 2) Determine the exponential function that satisfies the given conditions

a) Initial value=5, increasing at a rate of 17% per year

b) Initial population=28,900, decreasing at a rate of 2.6% per year

Example 3)

- a) Find the ratio of output values that correspond to increases of 1 in the input value in order to determine the growth or decay factor
- b) Determine the percent change
- c) Identify or determine the value of the function when  $x=0$
- d) Use the information in parts (a) through (c) to define a function formula for the relationship.

|      |    |   |   |      |
|------|----|---|---|------|
| x    | 0  | 1 | 2 | 3    |
| f(x) | 16 | 4 | 1 | 0.25 |

|      |     |     |        |         |
|------|-----|-----|--------|---------|
| x    | 1   | 2   | 3      | 8       |
| g(x) | 260 | 299 | 343.85 | 691.605 |

Example 4) Let  $f(x) = 34(1.19)^x$

- A) What does the 34 represent?
- B) What does the 1.19 represent?
- C) Fill in the blank: Whenever x increases by 1, the new output value is \_\_\_\_\_% of the old output value
- D) What is the percent change?

Example 5) Let  $f(x) = 1.578(0.68)^x$

- A) What does the 1.578 represent?
- B) What does the 0.68 represent?
- C) Fill in the blank: Whenever x increases by 1, the new output value is \_\_\_\_\_% of the old output value
- D) What is the percent change?
